

The Carriage Place Dental Centre made the conversion to digital radiography, in August 2010. We're really excited about it, and you should be too!

The main advantage of digital radiography over traditional film is a reduction in patient radiation of 60 - 70 %. Also images are available immediately for viewing, no more waiting for retakes. Further more most of our patients find the digital sensor much more comfortable in their mouths than the film, which had sharp edges. Other advantages with digital include avoiding the inconsistency of chemical processing, and disposal of hazardous waste and lead foil. Lastly, images can be easily transferred to other dentists and insurance companies, with current computer technology.
